PROFESSIONAL SUMMARY

Full-stack software engineer with 2+ years of experience shipping production features, strong on both the backend (Node.js, NestJS, PostgreSQL, MongoDB) and the frontend (React, TypeScript, Redux Toolkit, TanStack Query). Built high-volume campaign processing, database performance fixes, a visual workflow builder, merchant dashboards and Shopify checkout integrations.

PROFESSIONAL EXPERIENCE

Full-Stack Software Engineer | Fincart, Cairo — Apr 2026 – Present

- Cut database calls from ~100k to ~200 per 100k recipients when building campaign audiences for merchants with 500k+ contacts, using cursor-paged batch inserts with duplicate-free re-runs after crashes (NestJS, Prisma, PostgreSQL).
- Prevented accidental mass messaging by rejecting invalid audience filters instead of sending to every contact.
- Sped up order search from scanning 4,282 records to reading 1 per lookup by designing compound MongoDB indexes.
- Leading the migration of 6 courier integrations (Aramex, Bosta, FedEx, J&T, Turbo, YFS) onto one shared courier gateway (Factory pattern), with live end-to-end tests against courier APIs.
- Protected customer data in a Shopify checkout opt-in by resolving phone numbers on the server instead of trusting the browser, with Shopify session-token validation (Remix, Vitest).
- Designed a pluggable form architecture (Strategy pattern, NestJS) so new form types ship without changing core services, and used it to launch 7 storefront opt-in forms.
- Made a delivery-exception job resilient: batched streaming, and one failed record no longer stops the run (MongoDB).
- Ended manual lead imports for the Sales team by syncing sign-ups to Zoho CRM automatically, with no risk to signup.
- Built a canvas-based visual automation builder in React (React Flow, Redux Toolkit) with a custom auto-layout algorithm for branching flows, then reused the same engine to launch a second product, Campaigns.
- Shipped 3 merchant-facing feature areas in React and TypeScript: Campaigns (library, scheduling, 4-stage status flow), a Returns Center (5 status tabs, approve/reject/refund, role-based access) and analytics with 6 KPI cards.
- Built a shared UI component library in Storybook with CI builds, and launched Arabic/English (RTL) support portal-wide.

Full-Stack Software Engineer | Mercatura Forum, Cairo — Jul 2025 – Mar 2026

- Built multichain wallet interface (MENESE Protocol) – optimized balance fetching using React Query, significantly improving load times and user experience
- Developed backend services to fetch balances and transaction data from multiple blockchain networks via RPC endpoints
- Integrated frontend with backend APIs after comprehensive mocking and testing, ensuring robust error handling and state management

DevOps Intern | Giza Systems, Cairo — Nov 2025 – Dec 2025

- Built complete CI/CD pipeline using Jenkins for microservices project, automating deployment and testing workflows
- Implemented Infrastructure as Code (IaC) with Ansible to automate infrastructure provisioning and configuration management
- Deployed and maintained containerized applications using Docker in Linux environments, collaborating on Git workflows

Software Engineer Intern | EjadTech, Egypt — Aug 2023 – Sep 2023

- Developed backend logic for Point-of-Sale modules using Python and PostgreSQL
- Wrote SQL queries for database operations and collaborated with senior developers on implementation

KEY PROJECTS

Resilient Event Gateway | *NestJS, MongoDB, Redis, BullMQ, Docker*

- Built a webhook ingestion service on the transactional outbox pattern (HMAC-verified events saved atomically with their outbox entry, then published to BullMQ workers), with four idempotency layers, backoff retries and a dead-letter queue.
- Measured p95 ingestion latency of 77ms and zero lost events under a 20% simulated downstream failure rate.

E-Commerce REST API | *Node.js, Express, MongoDB, Redis, JWT, Swagger, Jest, Docker*

- Built an Amazon-style commerce backend with products, cart, orders, payments and role-based admin endpoints, with Redis caching, JWT/bcrypt auth, Swagger documentation and a Dockerized setup.

Sign Language Translator | Graduation Project (A+), *Flask, TensorFlow*

- Led the backend and ML integration for two-way sign, text and speech translation on mobile and web, with a BiLSTM model reaching 93.7% test accuracy and sub-second real-time translation, including live translation in video meetings.

More on GitHub: devTinder (Node.js, MongoDB, Docker)

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, Java, C#
Backend: Node.js, NestJS, Express.js, REST APIs, Prisma, TypeORM, Mongoose, BullMQ, Zod, Background Jobs, Shopify API
Frontend: React, TypeScript, Next.js, Redux Toolkit, TanStack Query, Zustand, React Flow, Tailwind CSS, MUI, Storybook, i18n/RTL
Databases: PostgreSQL, MongoDB, Redis, SQL Server
Cloud & Tools: Docker, GitHub Actions, CI/CD, Jenkins, Ansible (IaC), Google Cloud Storage, Linux, Git, Postman
Testing & Practices: Jest, Vitest, Playwright, E2E Testing, Design Patterns, DDD, CQRS, Agile/Scrum

EDUCATION

BEng in Computer and Systems Engineering | Helwan University, Cairo | Honors – Very Good (82.4%) — May 2025
